

# Blast Support

Real-time decision support for safe blasting

Blast support is a digital decision support tool to ensure improved personnel safety at blasting. 3D visualization with open space positioning gives the control room an overview of everyone's location.

## ⊕ Main benefits

**Assure personal safety** by securing people's location before blasting, in case of emergency or if accidents happen

**Blast on time** and increase productivity thanks to reduced time spent looking for people prior to blasting

**Relief stress** from personnel by enabling people positioning and instant messages to anyone entering an evacuation area

# Manage people's safety

Define hazardous areas in the 3D map such as blast areas, zones with a risk of falling rocks for example. Thanks to the seamless integration with the application Situational Awareness, you can both keep track of all people on-site and send zone-based messages. Blast support is a technology agnostic solution compatible with varius tags and virtual tags.

## Blast on time

Reduce time for blasts by optimizing the blast design and execution and ensuring that all personnel and equipment are cleared from the blast area on time.

Increase productivity and efficiency by monitoring the blast results and performance, and optimizing the material flow and haulage routes.

## Stress relief through digital empowerment

Enhance collaboration and coordination by enabling seamless communication between different teams and stakeholders and sharing relevant information and data. By empowering personnel with real-time information and digital tools for communication with people in the mine, stress around the blasting operation can be reduced.

Improve safety for employees, contractors and visitors by tracking their locations and alerting them of the blast schedule and countdown. Monitor blast shelters and refuge chambers and keep track of where people are located in real-time.
